---

## **CHAPTER 10 GASES**

**Inst. Dr. Dilek IŞIK TAŞGIN**  
**Inter-Curricular Courses Department**  
**Çankaya University**

# Characteristics of Gases

- Physical properties of gases are all similar.
- Composed mainly of nonmetallic elements with simple formulas and low molar masses.
- Unlike liquids and solids, gases
  - expand to fill their containers.
  - are highly compressible.
  - have extremely low densities.
- Two or more gases form a homogeneous mixture.

# Properties Which Define the State of a Gas Sample

- 1) Temperature
  - 2) Pressure
  - 3) Volume
  - 4) Amount of gas, usually expressed as number of moles
- Having already discussed three of these, we need to define pressure.

# Pressure

- **Pressure** is the amount of force applied to an area:

$$P = \frac{F}{A}$$

- **Atmospheric pressure** is the weight of air per unit of area.

# Units of Pressure

- **Pascals:**  $1 \text{ Pa} = 1 \text{ N/m}^2$  (SI unit of pressure)
- **Bar:**  $1 \text{ bar} = 10^5 \text{ Pa} = 100 \text{ kPa}$
- **mm Hg or torr:** These units are literally the difference in the heights measured in mm of two connected columns of mercury, as in the **barometer** in the figure.
- **Atmosphere:**  
 $1.00 \text{ atm} = 760 \text{ torr} = 760 \text{ mm Hg}$   
 $= 101.325 \text{ kPa}$

# Manometer

$$P_{\text{gas}} = P_{\text{atm}} + P_h$$

The **manometer** is used to measure the difference in pressure between atmospheric pressure and that of a gas in a vessel. (The barometer seen on the last slide is used to measure the pressure in the atmosphere at any given time.)

# Standard Pressure

- Normal atmospheric pressure at sea level is referred to as **standard atmospheric pressure**.
- It is equal to
  - 1.00 atm.
  - 760 torr (760 mmHg).
  - 101.325 kPa.

# Boyle's Law

The volume of a fixed quantity of gas at constant temperature is inversely proportional to the pressure.

# Mathematical Relationships of Boyle's Law

- $PV = \text{a constant}$
- This means, if we compare two conditions:  
 $P_1 V_1 = P_2 V_2.$
- Also, if we make a graph of  $V$  vs.  $P$ , it will *not* be linear. However, a graph of  $V$  vs.  $1/P$  will result in a linear relationship!

# Charles's Law

- The volume of a fixed amount of gas at constant pressure is directly proportional to its absolute temperature.

# Mathematical Relationships of Charles's Law

- $V = \text{constant} \times T$
- This means, if we compare two conditions:  
 $V_1/T_1 = V_2/T_2$ .
- Also, if we make a graph of  $V$  vs.  $T$ , it will be linear.

# Avogadro's Law

- The volume of a gas at constant temperature and pressure is directly proportional to the number of moles of the gas.
- Also, at STP, one mole of gas occupies 22.4 L.
- Mathematically:  $V = \text{constant} \times n$ , or  $V_1/n_1 = V_2/n_2$

	He	N <sub>2</sub>	CH <sub>4</sub>
Volume	22.4 L	22.4 L	22.4 L
Pressure	1 atm	1 atm	1 atm
Temperature	0 °C	0 °C	0 °C
Mass of gas	4.00 g	28.0 g	16.0 g
Number of gas molecules	$6.02 \times 10^{23}$	$6.02 \times 10^{23}$	$6.02 \times 10^{23}$

# Ideal-Gas Equation

- So far we've seen that

$$V \propto 1/P \text{ (Boyle's law).}$$

$$V \propto T \text{ (Charles's law).}$$

$$V \propto n \text{ (Avogadro's law).}$$

- Combining these, we get

$$V \propto \frac{nT}{P}$$

- Finally, to make it an equality, we use a constant of proportionality ( $R$ ) and reorganize; this gives the Ideal-Gas Equation:  $PV = nRT$ .

# Density of Gases

If we divide both sides of the ideal-gas equation by  $V$  and by  $RT$ , we get

$$n/V = P/RT.$$

Also: moles  $\times$  molecular mass = mass

$$n \times M = m.$$

If we multiply both sides by  $M$ , we get

$$m/V = MP/RT$$

and  $m/V$  is density,  $d$ ; the result is:

$$d = MP/RT.$$

# Density & Molar Mass of a Gas

- To recap:
- One needs to know only the molecular mass, the pressure, and the temperature to calculate the density of a gas.
- $d = MP/RT$
- Also, if we know the mass, volume, and temperature of a gas, we can find its molar mass.
- $M = mRT/PV$

# Volume and Chemical Reactions

- The balanced equation tells us relative amounts of moles in a reaction, whether the compared materials are products or reactants.
- $PV = nRT$
- So, we can relate volume for gases, as well.
- For example: use ( $PV = nRT$ ) for substance  $A$  to get moles  $A$ ; use the mole ratio from the balanced equation to get moles  $B$ ; and ( $PV = nRT$ ) for substance  $B$  to get volume of  $B$ .

# Dalton's Law of Partial Pressures

- If two gases that *don't* react are combined in a container, they act as if they are alone in the container.
- The total pressure of a mixture of gases equals the sum of the pressures that each would exert if it were present alone.
- In other words,

$$P_{\text{total}} = p_1 + p_2 + p_3 + \dots$$

# Mole Fraction

- Because each gas in a mixture acts as if it is alone, we can relate amount in a mixture to partial pressures:

$$\frac{P_1}{P_t} = \frac{n_1 RT/V}{n_t RT/V} = \frac{n_1}{n_t}$$

- That ratio of moles of a substance to total moles is called the **mole fraction**,  $\chi$ .

$$X_1 = \frac{\text{Moles of compound 1}}{\text{Total moles}} = \frac{n_1}{n_t}$$

# Pressure and Mole Fraction

- The end result is

$$P_1 = \left( \frac{n_1}{n_t} \right) P_t = X_1 P_t$$

# Kinetic-Molecular Theory

Pressure inside container comes from collisions of gas molecules with container walls

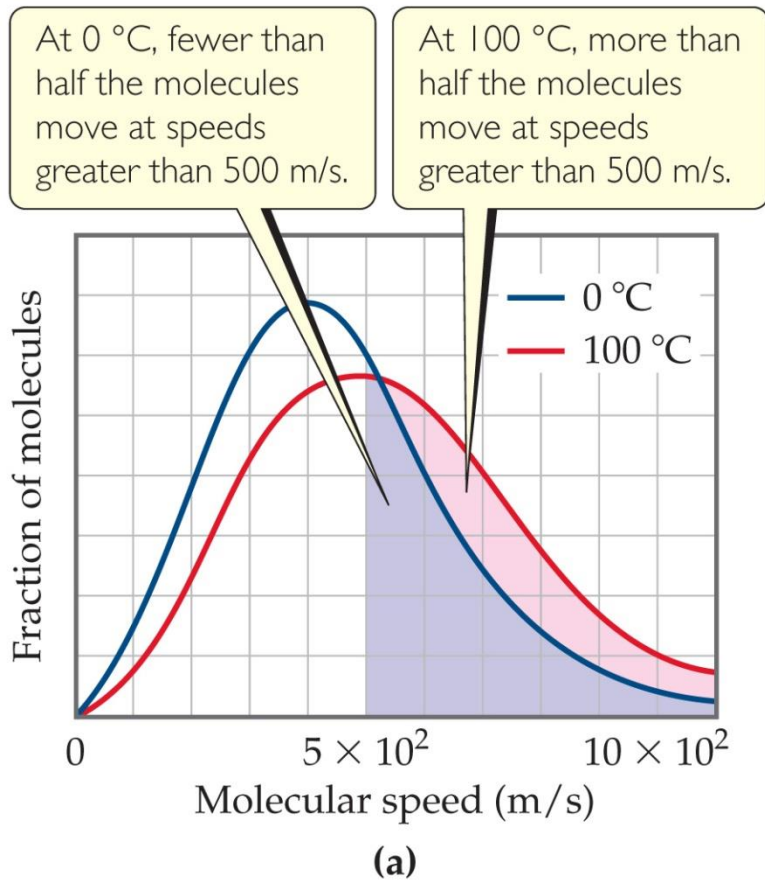

- *Laws* tell us *what* happens in nature. Each of the gas laws we have discussed tell us what is observed under certain conditions.
- *Why* are these laws observed? We will discuss a *theory* to explain our observations.

# Main Tenets of Kinetic-Molecular Theory

- 1) Gases consist of large numbers of molecules that are in continuous, random motion.
- 2) The combined volume of all the molecules of the gas is negligible relative to the total volume in which the gas is contained.
- 3) Attractive and repulsive forces between gas molecules are negligible.

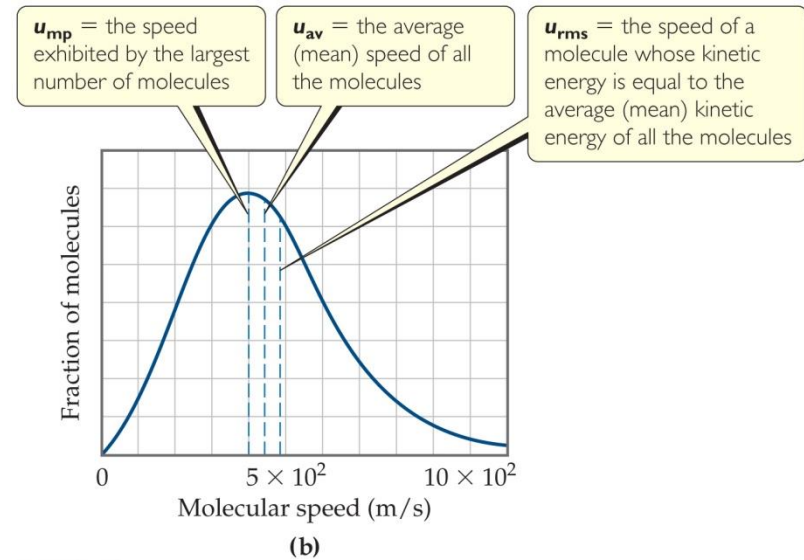

# Main Tenets of Kinetic-Molecular Theory

- 4) Energy can be transferred between molecules during collisions, but the *average* kinetic energy of the molecules does not change with time, as long as the temperature of the gas remains constant.
- 5) The average kinetic energy of the molecules is proportional to the absolute temperature.

# How Fast Do Gas Molecules Move?

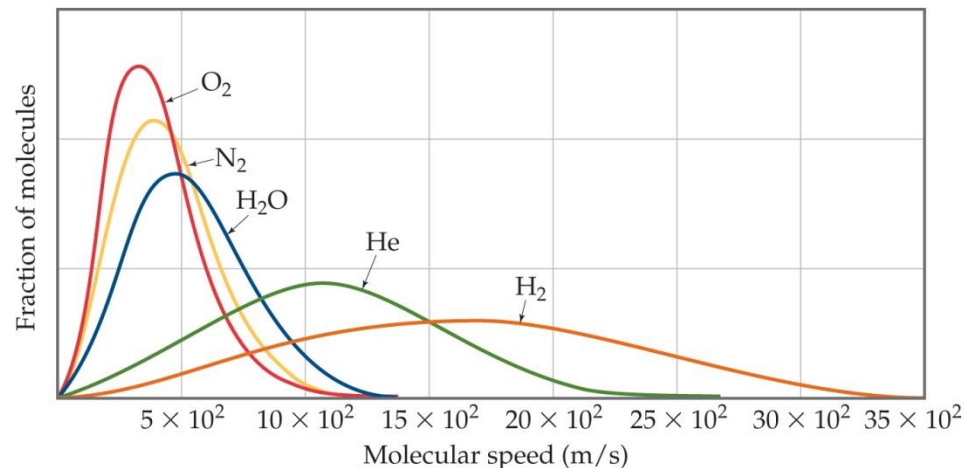

- Temperature is related to their *average* kinetic.
- Individual molecules can have different speeds of motion.
- The figure shows three different speeds:
  - $u_{mp}$  is the most probable speed (most molecules are this fast).
  - $u_{av}$  is the average speed of the molecules.
  - $u_{rms}$ , the root-mean-square speed, is the one associated with their average kinetic energy.

# $u_{\text{rms}}$ and Molecular Mass

$$u_{\text{rms}} = \sqrt{\frac{3RT}{\mathcal{M}}}$$

- At any given temperature, the average kinetic energy of molecules is the same.
- So,  $\frac{1}{2} m (u_{\text{rms}})^2$  is the same for two gases at the same temperature.
- If a gas has a low mass, its speed will be greater than for a heavier molecule.

# Effusion & Diffusion

**Effusion** is the escape of gas molecules through a tiny hole into an evacuated space.

**Diffusion** is the spread of one substance throughout a space or a second substance.

# Graham's Law Describes Diffusion & Effusion

- Graham's Law relates the molar mass of two gases to their rate of speed of travel.
- The “lighter” gas always has a faster rate of speed.

$$\frac{r_1}{r_2} = \sqrt{\frac{\mathcal{M}_2}{\mathcal{M}_1}}$$
